

Medford Water Commission - SHOWERHEADS

Another big user of water in the bathroom is the shower. Showerheads manufactured today can provide a refreshing shower at a flow rate of 2.5 gallons per minute – a fraction of the water of guzzlers installed prior to 1980, which had flow rates of 5 to 8 gallons per minute. Replacing a showerhead is an easy way to save water, and you'll save on your power bill too since you won't have to heat as much water. New [WaterSense](#)[®] certified showerheads are also available and use no more than 2.0 gallons per minute without sacrificing comfort. There are other ways to save as well, such as:

- Simply taking shorter showers will save gallons of water.
- Turn the water down when full force isn't needed.
